Challenges in High Precision Beamline Alignment at the ESRF  
FIG Working Week Christchurch New Zealand 2016

# SO WHAT IS A SYNCHROTRON RADIATION LIGHT SOURCE?

The linear accelerator (linac) accelerates the electrons from rest mass to 100 MeV

The booster accelerates the electrons from 100MeV to 6GeV

The storage ring keeps the electrons circulating at 6GeV for many hours

The 6GeV electrons produce synchrotron radiation in a tangential direction to the beam travel

A synchrotron radiation light source is composed of two main elements:

- A particle accelerator that accelerates electrons to nearly the speed of light, and
- Beamline(s) that use the synchrotron radiation generated by the accelerator to study matter.

*One eV is the amount of energy gained (or lost) by the charge of a single electron moved across an electric potential difference of one volt.*

# WHAT IS SYNCHROTRON RADIATION

When electrons are accelerated they generate synchrotron radiation

Synchrotron radiation is on the electromagnetic spectrum - light

The wavelength of this light is a function of the electron energy

The ESRF electron velocity is very close to the speed of light\*

The wavelength of the light is in the hard X-ray regime

The wavelengths of X-rays are small so they can be used to look at the atomic structure of matter

$$E=mc^2$$

\*When  $E=6$  GeV the velocity of the electrons is 0.99999993 times the speed of light

# THE ELECTROMAGNETIC SPECTRUM

INFRARED 720-850nm

VISIBLE 440-640nm

ULTRAVIOLET 335-365nm

X-RAY 0.025 nm

A good example of the type of science made at the ESRF is crystallography using X-ray diffraction.

A **crystal** is a solid material whose constituent atoms, molecules or ions, are arranged in a **highly ordered microscopic structure**, forming a **lattice** that extends in all directions.

# CRYSTALLOGRAPHY AND X-RAY DIFFRACTION

The atoms comprising the crystal structure form planes. When X-rays are incident on these crystal planes they are diffracted and produce a characteristic pattern of spots

# BRAGG'S LAW

William Lawrence Bragg  
William Henry Bragg  
1915 Nobel Physics

$$n\lambda = 2d \sin \theta$$

Bragg's law provides an elegant and powerful description of diffraction from crystals. It describes how constructive interference leads to the pattern of X-ray diffraction spots. Qualitatively, the diffraction picks up a *specific distance* in real-space, and transforms it into a frequency in *reciprocal space*.

The same techniques can be used to image complex systems such as proteins

# X-RAY CRYSTALLOGRAPHY METHOD

X-ray diffraction

X-ray diffraction Images

Protein Model

Electron Density Map

Form  $\longrightarrow$  Function

This technique has led to the discovery of some fantastically complex structures like the ribosome.

Ada Yonath, Venkatraman Ramakrishnan and Thomas Steitz were awarded the 2009 Nobel prize in Chemistry for their work on the ribosome

← 20 nm →

# THE SCALE OF THINGS AND THE IMPORTANCE OF ALIGNMENT

A crystal is placed on the end of the pin with a stream of cool air coming in from the right. The X-ray beam arrives from the silver pipe and the camera images the crystal

# THE STORAGE RING NETWORK

The main accelerator network is long and narrow

... and very regular

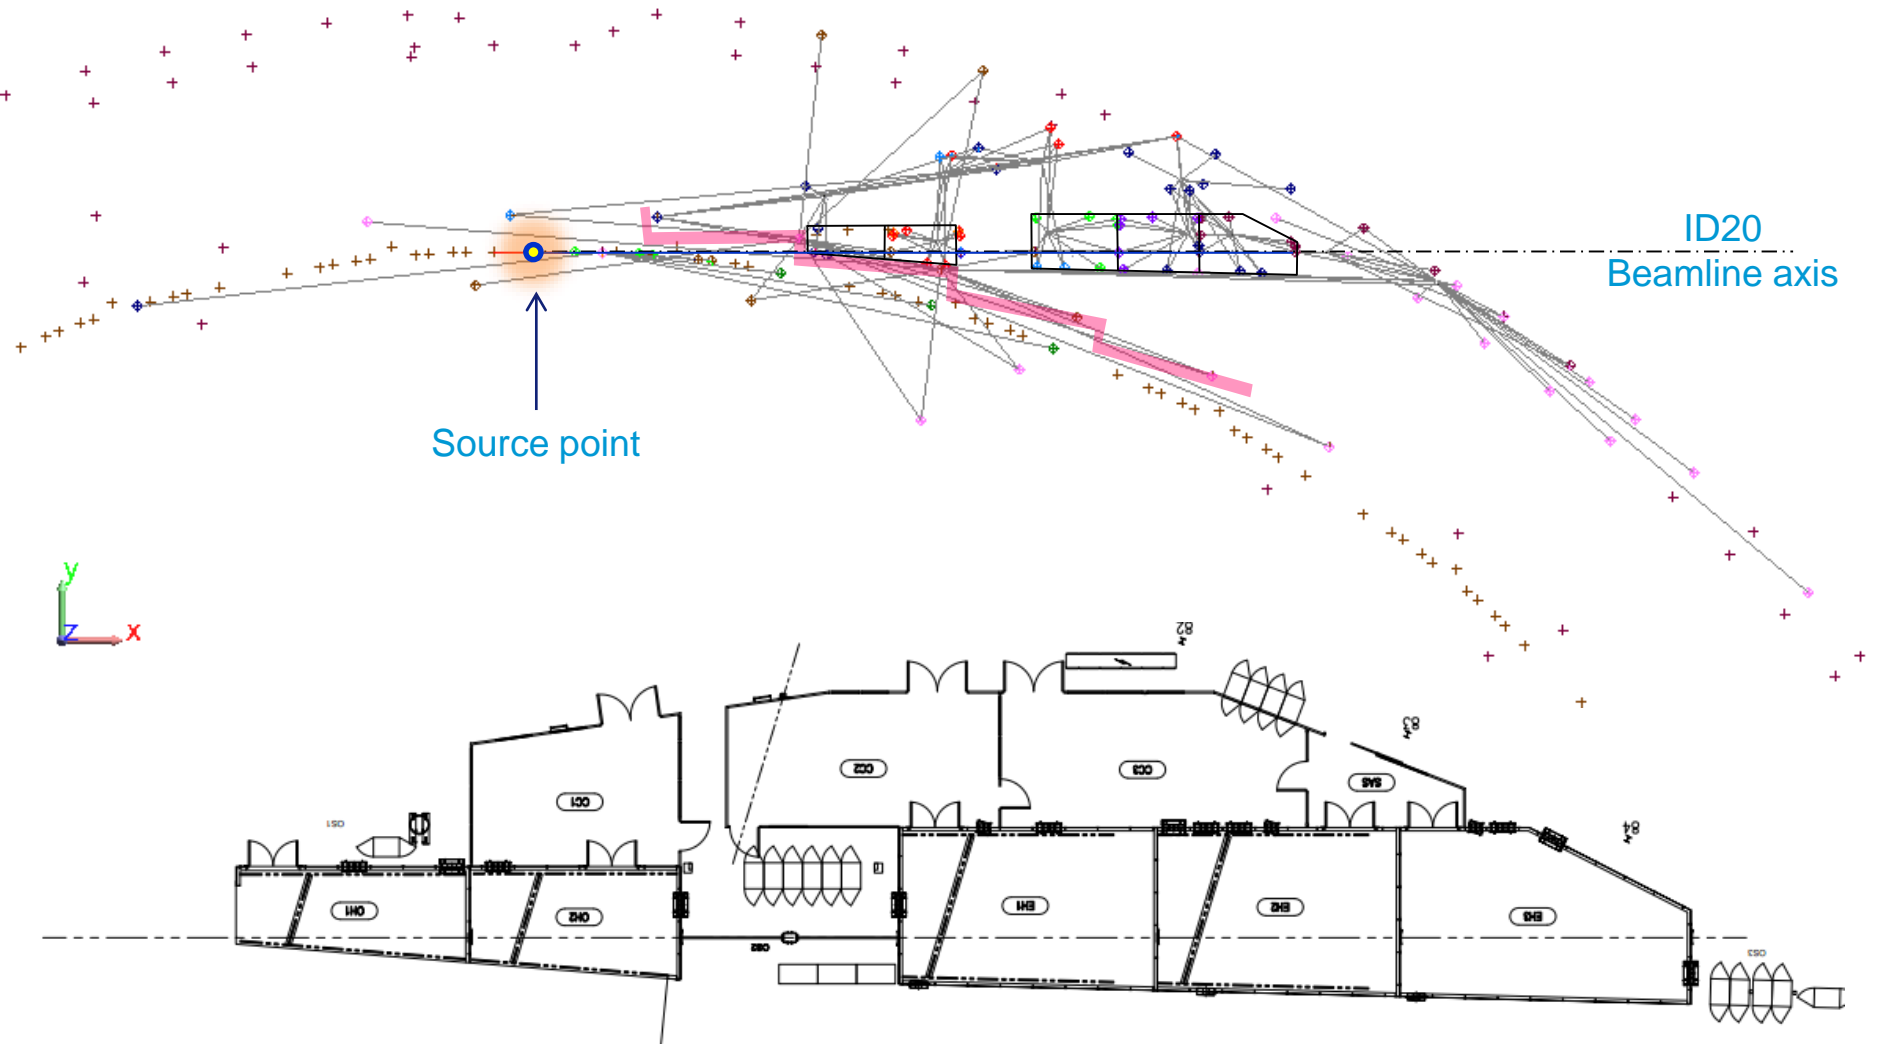

There are close to 2500 distance, horizontal angle and vertical angle measurements to the 320 points in the network.

-  Instrument Station
-  Quadrupole
-  Dipole

# BEAMLINE NETWORK

Crystallography determines the arrangement of atoms in the crystalline solids.

X-rays are also useful to image very small hidden things.

Phase contrast  
microtomography

At the ESRF  $p=150$  m and  $q=0.05$  m so  $q/p=3000^{-1} \rightarrow$  theoretical probe size  $\sim 10$  nm

The size of the focused x-ray probe spot depends on:

- the source size,
- the distance between the source and the focusing optics  $p$ , and
- the working distance between optics and the experimental sample  $q$ .

## Ebola in graphics

# The toll of a tragedy

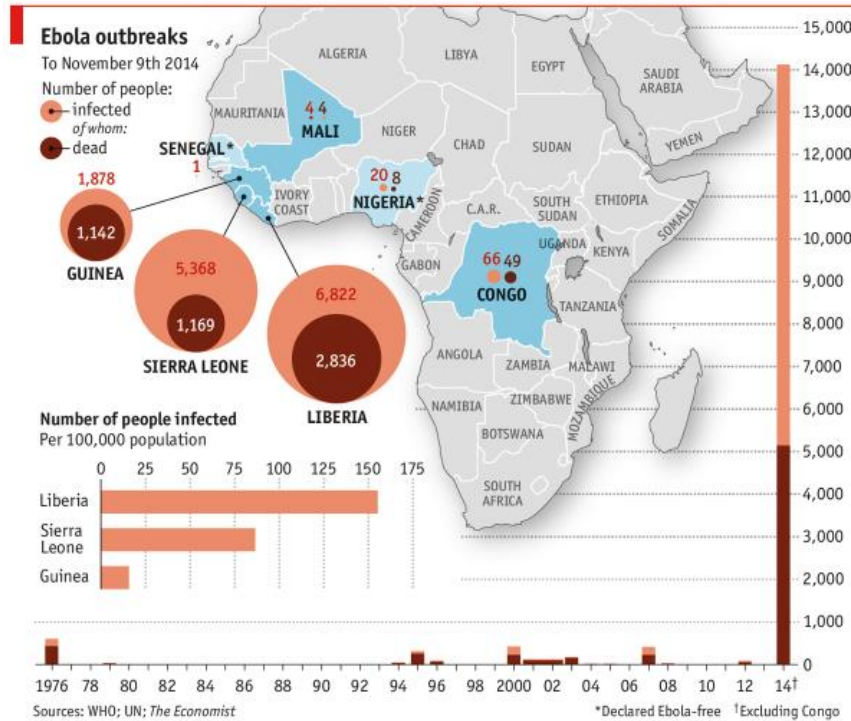

Nov 12th 2014, 19:59 BY THE DATA TEAM

174

189

Economist.com/graphicdetail

28,616 cases and 11,310 deaths had been reported

(<http://www.cdc.gov/vhf/ebola/outbreaks/2014-west-africa/case-counts.html>)

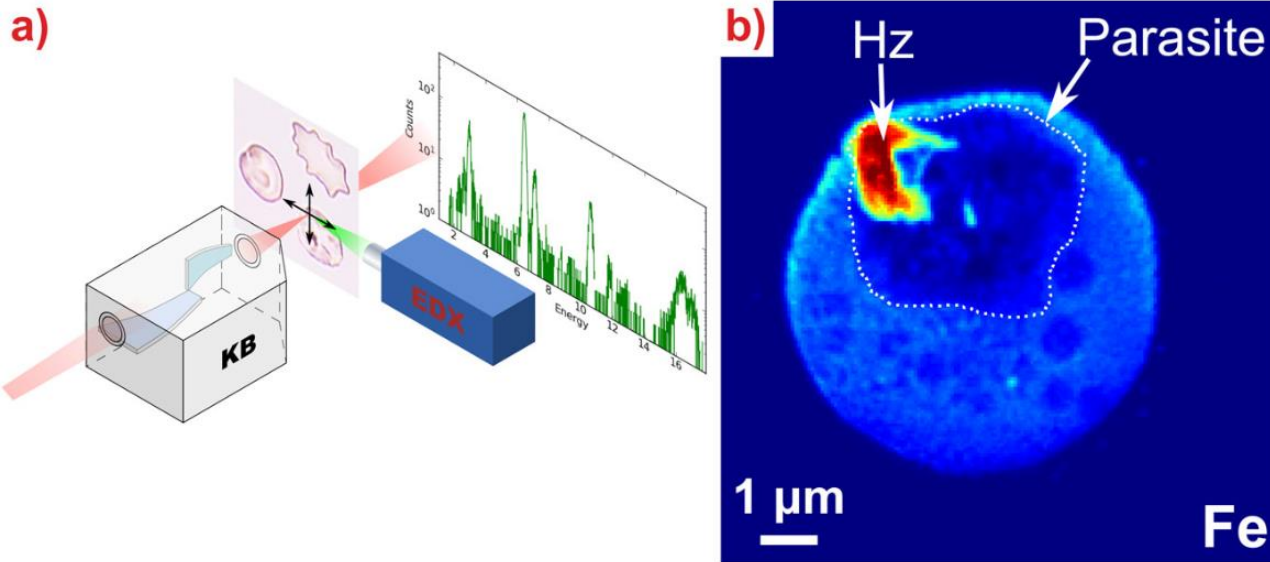

As tragic as these numbers are, they are quite simply dwarfed by numbers associated with malaria

...an estimated **207 million cases** (uncertainty interval, 135–287 million) and **627 000 malaria deaths** (uncertainty interval, 473 000–789 000) are estimated to have occurred in 2012. ...

*WHO World Malaria Report 2013 p ix*

An acute need for new drugs exists because **resistance has developed to all antimalarial drugs**. Overcoming drug resistance is an essential goal of antimalarial drug discovery.

Imaging of trace elements with a **spatial resolution of 50 nm** at detection limits down to the attogram (i.e.  $10^{-18}$ ) level.

...This study provides the first demonstration of the localisation of unlabelled antimalarial drugs at pharmacological doses with high spatial resolution. This strategy improves the understanding of the action mechanisms of both existing and novel antimalarial drugs. Moreover, this approach may be applied to a wide range of domains where the quantitative chemical imaging of drugs at the subcellular level is critical....

*Nanochemical imaging of antimalarial drugs in Plasmodium falciparum infected red blood cells*
